1 Purpose

This LGS gives information about the dimensions and the surface quality which must be observed during the refinishing work, it also provides the work instructions.

2 Scope

This LGS applies to the LESER sites Hamburg and Hohenwestedt as well as for valve repair shops repairing and / or maintaining LESER valves. This LGS is valid for:

- full nozzles
- nozzles
- discs with removable lifting gear (called disc)

The scope of the product group High Performance includes Type 441/442, 455/456, 457/458 and 444. Furthermore, flanged safety valve with lever and weight type 421 is also included because dimensions are identically to type 441.

3 References

Not applicable.

4 Conditional Agreement

The further mentioned rules for the refinishing of nozzles and discs have been issued and explained in all conscience and describe the final design of the components.

LESER reserves the right to make necessary modifications at the components without determining these changes in this standard directly. So, if there are any doubts on user side when applying these guidelines, LESER must be contacted before performance of rework to clarify the actual situation.

When applying these guidelines, it must be considered generally that they describe the refinishing at components which influence the function and capacity of the safety valves. Even marginal deviations to this guideline can affect a malfunction or constricted capacity of the safety valve and therewith an inadmissible pressure increase can arise during application/operation. This could possibly have serious consequences for humans and environment. Therefore, it must be proceeded carefully when applying these rules.

LESER assumes no liability for safety devices which have been repaired or reworked in accordance with this LGS. The repair shop is solely responsible for the function and capacity of the re-introduced safety device.

The user of this LGS should be clear on the fact that the repair of a safety device against inadmissible overpressure is subjected to international laws. The violation of valid rules will be traced and avenged acc. to relevant legislations.

In case of any doubts during application of this LGS, LESER must be consulted before starting repair or rework of LESER safety devices.

5 Introduction

If the sealing surfaces of nozzles and discs have been damaged, the original sealing quality can be restored by refinishing of the sealing surfaces. The minimum and maximum dimensions given in the tables below must be ensured.

Other additional rework like Hardfacing (build-up welding) or similar activities at the surfaces are not allowed.

6 Execution

The refinishing by smooth turning and grinding with final lapping should be done on the nozzle and if necessary, also on the disc with the least possible material removal. Please refer to the limiting values in the following tables.

These critical dimensions apply to High Performance valves and supersede any dimensions provided in previous versions or revisions.

6.1 Measures and facing profile

Tables, together with the corresponding figures, contain the linear and angle dimensions which shall be observed. After processing of the nozzle surface, it is also important that the profile of the sealing area is restored moderately using inner and outer chamfers.

6.2 Surface Quality

A surface quality to a mean roughness depth of R_z 0,25 (DIN EN ISO 4287) or AA 1 (ASME B46.1) must be achieved on both sealing surfaces through lapping.

In the case of plastic and soft sealing, different surface qualities may be as shown in the figures. These sealing surfaces may be achieved alternatively through smooth turning.

6.3 Test

In a final test on the mounted valve, it must be guaranteed that:

- The semi rings on the spindle must be off the guide when the valve is closed.
- The lower spring plate may not touch the guide when the spring is assembled.
- In case of lift restricted valves, the lift restriction must be checked and if necessary, the lift restriction bushing extended or lift restriction screw adjusted.

doc. type:	LGS	change rep. No.:	NA	retention period:	10y.	prot. class:	public

7 Refinishing nozzle and disc, High Performance valves, metal sealing

Work is to be carried out according to Figure 1 and Figure 2 and according to Table 1 to Table 2.

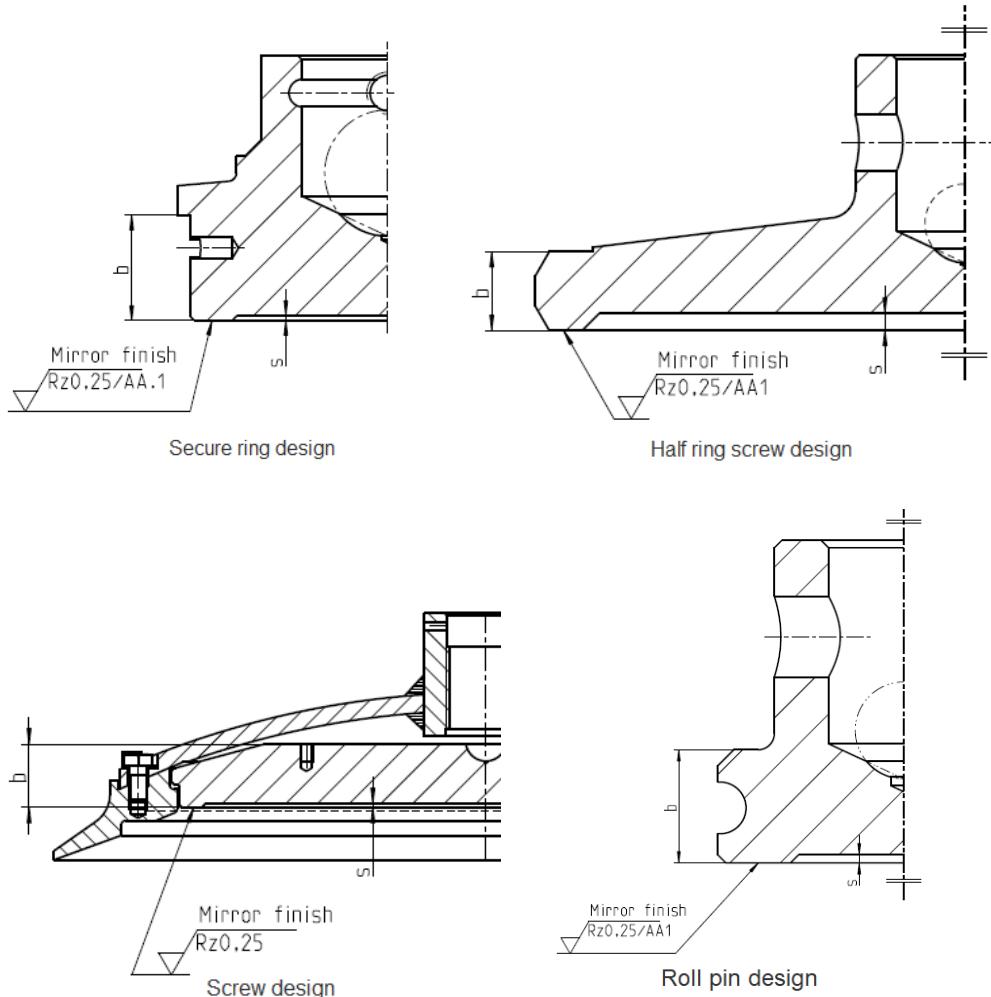

Figure 1. Disc, metal sealing.

Disclosure cat.:	I	proofread by:	BBÜ	publish date:	01/28/24	effect. date:	01/24
author:	Haa	released by:	JR	replaces:	initial	status:	Published

doc. type:	LGS	change rep. No.:	NA	retention period:	10y.	prot. class:	public

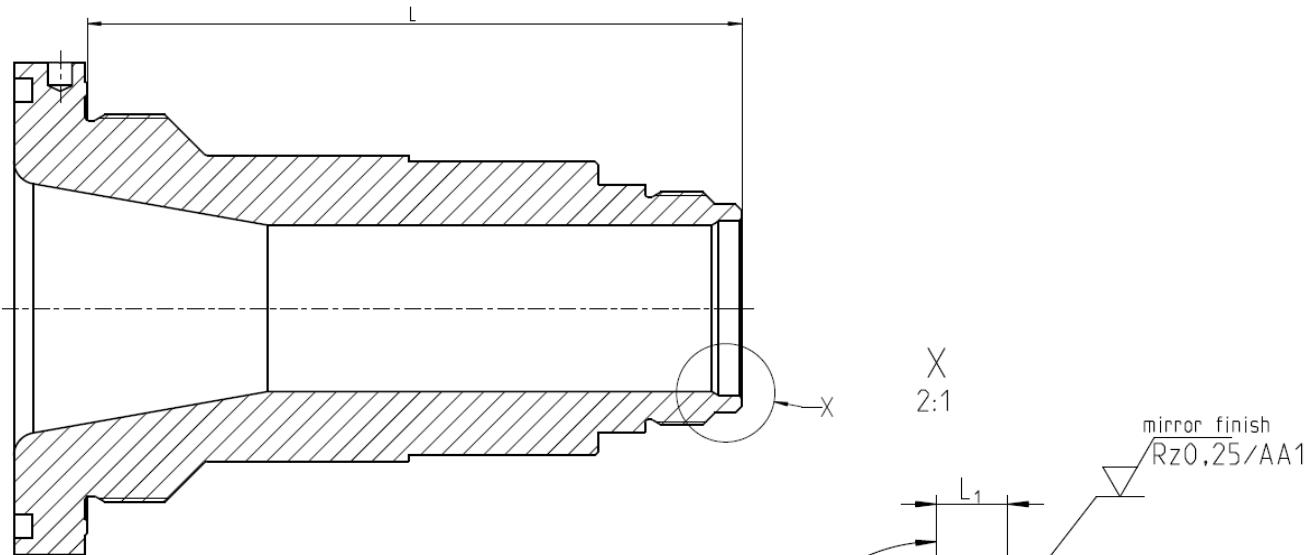

Figure 2. Full nozzle.

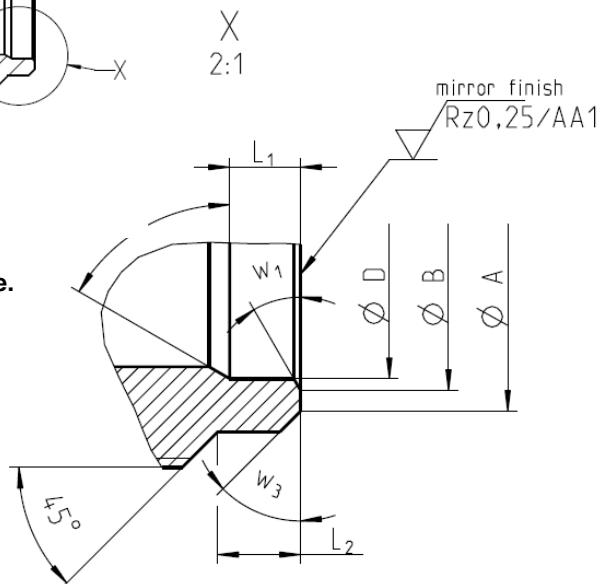

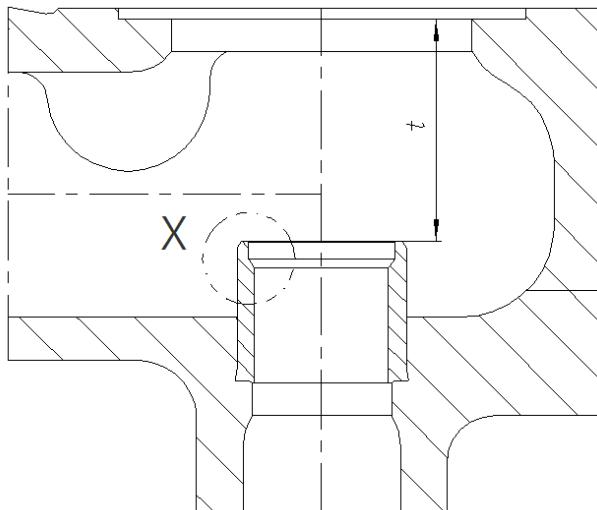

Figure 3. Nozzle.

Changes in dimension may only be such as not to reduce dimensions b and/or L below its lower limit.

Changes in dimension may only be such as not to exceed dimension t above its upper limit.

The dimensions A and B of the sealing area of the nozzle shall be restored with inner and outer chamfering within its limits.

8 Refinishing disc, High Performance valves, plastic sealing

Only a small number of discs were made with plastic sealing. In case of refinishing please contact LESER to provide limits of critical dimensions. If damaged, a replacement is recommended. For nozzles refer to Table 1 to Table 2.

9 Refinishing disc, High Performance valves, soft sealing

It is not permitted to rework the soft sealing disc. If damaged, a replacement is recommended. For nozzles refer to Table 1 to Table 2. In case of flat sealing disc follow chapter 9.1.

9.1 Seat geometry of flat sealing O ring disc design for valves type 441/442 delivered before year 2002.

The flat sealing O ring disc design has not been supplied since the redesign of the O ring disc in year 2002. For refinishing flat sealing disc design see the following details.

The flat sealing disc design is identified internally by option code "F-Text" L40 up to L43.

Work is to be carried out according to Figure 4 and according to Table 3 to Table 4.

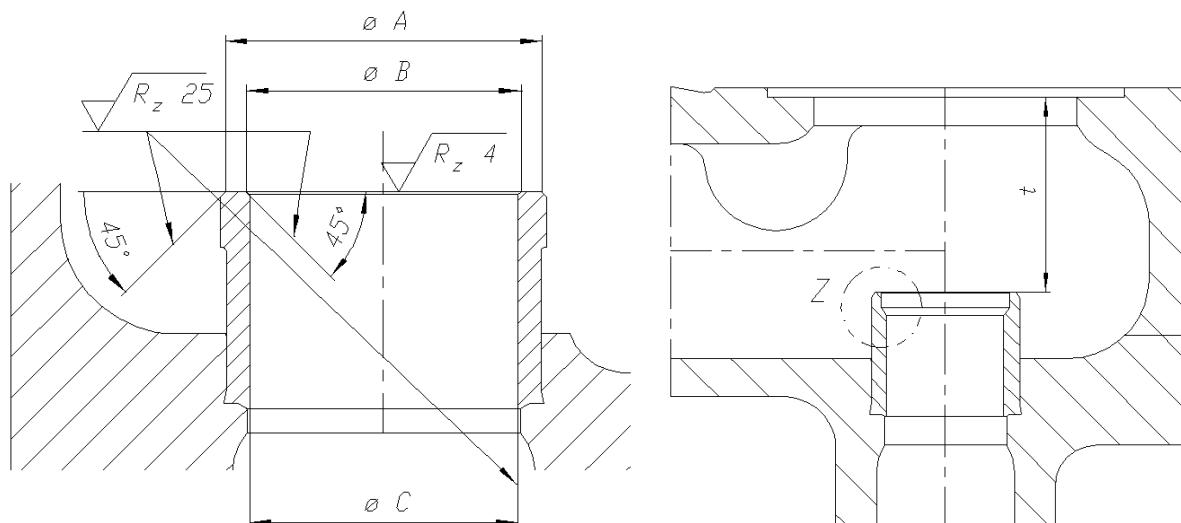

Figure 4. Nozzle, flat sealing O ring disc design.
